## What This Means

The portfolio profile should be read as a trade-off between return, realized drawdown, and market sensitivity. CAGR measures compound annual growth, volatility measures annualized variability, and maximum drawdown captures the largest peak-to-trough loss in the reporting window. Sharpe and Sortino summarize risk-adjusted return, while market sensitivity indicates how strongly the portfolio moves with the broad benchmark.

## Risk Structure

Stress status: One risk area requires attention. Worst scenario loss: -22.16%. Flagged scenario: recession\_severe; flagged test: Loss. These diagnostics are used to identify risk concentrations and scenario vulnerability; they do not by themselves replace the mandate checks.
